

Uniquely ULS

Universal Laser Systems GmbH

Auto-Recognition of Accessories

Universal Laser Systems, Inc. (ULS) has introduced Auto-Recognition of Accessories technology on its new VLS and PLS line of CO₂ laser cutting, marking and engraving systems.

The systems automatically detect the installation of the rotary fixture attachment, the downdraft honeycomb cutting table and the compressed air unit and compensate accordingly.

Upon installation of the rotary fixture attachment, the systems automatically makes all of the adjustments necessary for rotary marking and engraving.

Upon installation of the downdraft honeycomb cutting table, the systems automatically corrects the focus to compensate for the increased table height.

Upon installation of the compressed air unit, the system automatically activates the unit when a job is in progress.

Auto-Recognition of Accessories technology is just one of several Uniquely Universal benefits that showcases the higher quality standards of ULS laser systems.
