### Universal Control Panel with Print Preview

Universal Laser Systems, Inc. (ULS) has introduced a Universal Control Panel with Print Preview feature on its new VLS and PLS line of CO<sub>2</sub> laser cutting, marking and engraving systems.

With the Universal Control Panel (UCP), users can preview a job on-screen before it is actually run to ensure proper setup. It is also possible to view, edit and re-run stored print jobs directly from the Universal Control Panel at any time without the need to open the graphic software file from which it was created.

Users can access the UCP by clicking on the blue, diamond-shaped icon in the lower right corner of the Windows® taskbar. The UCP will open the Print Preview screen and display the file name and number of the job, the date and time it was stored and the run time.

Many other functions are available directly from the UCP. Users can home the laser carriage and engraving table; move the laser carriage position via on-screen virtual cursor keys; launch the manual focusing mode; display the saved system power, speed and ppi settings for the current onscreen print job; and zoom in or out on the Print Preview image.

The Print Preview feature is just one of several Uniquely Universal benefits that showcase the higher quality standards of ULS laser systems.
