Universal Laser Systems GmbH

Job Time Estimator

Universal Laser Systems, Inc. (ULS) has introduced a Job Time Estimator on its new CO₂ laser cutting, marking and engraving systems.

The Job Time Estimator provides a reliable approximation of the time necessary to process a job once it has been sent to the Universal Control Panel. This powerful feature can be used to calculate run times for raster, vector and combined raster/vector single file operations.

The Job Time Estimator is a great tool for engravers who charge by the minute for their services. It allows them to quote an upfront cost to their customers without having to actually run a job to get the processing time. It is also a useful tool for planning daily workload with maximum efficiency.

To use the Job Time Estimator feature, select a job from the ULS laser system print cache and click on the Job Estimator tab. Click "Start" and the Estimator will calculate and display how long the job will take to process. Click the tab a second time to close the Estimator.

The new Job Time Estimator feature is just one of several Uniquely Universal benefits that showcases the higher quality standards of ULS laser systems.
